

1. Create organization identity

First, a new identity, with associated DID(s), needs to be created for the tuple (organization, environment).

Using API

Perform the following REST API call. Note that `subject` is optional.

```
POST <internal Nuts interface>/internal/vdr/v2/subject
```

```
Content-Type: application/json
```

```
{"subject": "fooorg-acc"}
```

Using Nuts Admin

1. Log in to the **organization**'s Nuts Admin application. Click on "Identities".
2. Click on the plus sign on the right side.
3. Enter the subject: it consists of the tenant, dash, short form of the environment (e.g. `fooorg-acc`). This will act as key when interacting with the Nuts node's APIs for this instance. *Note: as deployments are isolated, theoretically, a static key could be used. But having the tenant and environment in the name reduces the possibility of leakage due to mixed-up environments.*
4. Click on "Create Identity".
