Multiple systems on the sender's side

The following challenges rise when a customer makes use of multiple software systems that own different pieces of patient's data and wants to send data through eOverdracht:

1. The customer usually wants to send all the patient's data in one eOverdracht session instead of starting multiple eOverdrachts in all systems.
2. The customer usually wants to send different combinations of data from different systems depending on what services the patient gets from the customer (e.g. inpatients and outpatients may receive different services, or some of the care patients receive treatment and some of them don't).
